Understanding Post Decay

Post decay occurs when certain **conditions** exist; moisture saturation of wood fiber, oxygen & temperature range of 40 to 100° F. Together these **conditions** enable the living micro-organisms, abundant in soil, to colonize the post using the wood fiber as their food source.

Post Protector is a “Barrier System” that eliminates soil contact and the ability for the soil dwelling micro-organisms, the **cause** of decay, to access the post.

- ↳ “Landfill Liner” material has an impressive 449 years of geo-application life!
- ↳ “Barrier System” eliminating “soil-to wood” & “concrete-to-wood” contact.
- ↳ Retains typical “post in the ground” construction technique.
- ↳ Complete post protection from the bottom of the post-hole to above finished floor grade.
- ↳ “Build It Green” The safe, responsible way to set treated posts in the ground! Chemical treatment stays in the post!
- ↳ Framing Friendly—designed to easily accept framing.
- ↳ Lightweight, flexible & strong.
- ↳ Stronger, faster, and less expensive than the concrete pier & steel bracket method.
- ↳ Horizontal, perimeter ribs yield substantial post uplift protection.
- ↳ Attractive Appearance—rich clay tone color with wood grain texture.
- ↳ Vertical venting system allows the post to breathe.
- ↳ Easily trims to desired height.
- ↳ Simple, slide-on installation.
